

VOIGHT-KAMPFF

Generative AI Detection Report

Analysis Time: 2026-09-14 18:18:50

1. Detection Result

Metric	Value
Prediction	AI Generated
AI Probability	99.78%
Human Probability	0.22%
Perplexity	27.4734
Burstiness Score	0.6061
Burstiness Level	High

2. Input Text

Artificial intelligence is transforming modern industries.
Machine learning systems can analyze large amounts of data
and help organizations make better decisions.

3. Linguistic Analysis

Feature	Value
Word Count	21
Sentence Count	2
Unique Words	21
Lexical Diversity	1.0
Avg Sentence Length	10.5
Sentence Length Std	6.364
Punctuation Count	2
Punctuation Ratio	0.0123
Character Count	163
Average Word Length	6.7143

4. Burstiness Analysis

Burstiness Score: 0.6061
Burstiness Level: High
Mean Sentence Length: 10.5
Sentence Length Standard Deviation: 6.364

5. Perplexity Analysis

Perplexity Score: 27.4734

Perplexity measures how predictable a sequence of words is to a language model. It is used as a supporting signal in the Voight-Kampff system and should not be treated as independent proof of AI-generated content.

6. GenAI Explanation

Prediction:

AI Generated

Confidence:

Extremely high confidence. The primary RoBERTa transformer classifier assigned a 99.78% probability that the text is AI-generated, leaving only a 0.22% probability for human authorship.

Reasoning:

The determination relies primarily on the RoBERTa classifier, which detected deep contextual and stylistic patterns typical of modern AI language models. Supporting metrics, such as a low perplexity score, align with this classification by showing high text predictability, though the primary transformer model remains the main foundation for the prediction.

Linguistic Analysis:

The excerpt is short, containing 21 words across 2 sentences with an average word length of 6.71 characters. It features high lexical diversity (1.0) because no words are repeated, and uses formal, clear vocabulary ("transforming," "organizations," "intelligence"). While these linguistic features show polished and concise writing, they act only as supporting context rather than primary proof of authorship.

Burstiness Analysis:

The text returned a burstiness score of 0.6061, categorized as "High." Burstiness evaluates variations in sentence length and structure. Human writing typically exhibits high burstiness, but in this specific case, the score is mathematically inflated due to evaluating only two sentences (one of 7 words and one of 14 words). Burstiness alone cannot prove whether text is human or AI-generated, especially on very short samples.

Perplexity Analysis:

The perplexity score is 27.47, which is relatively low. Perplexity measures how unexpected or surprising word choices are to a language model; lower scores mean the text is smooth, standard, and highly predictable. AI models tend to produce text with lower perplexity. However, low perplexity alone does not confirm AI generation, as human writers can also craft simple, predictable sentences.

Final Assessment:

The analysis strongly indicates that the text is AI-generated, driven predominantly by the RoBERTa model's high confidence (99.78%) and supported by a low perplexity score. However, AI detection relies on statistical probabilities rather than absolute proof; therefore, this assessment cannot offer 100% certainty, particularly given the brevity of the analyzed text.

Disclaimer: Voight-Kampff provides a probabilistic assessment of whether text may be AI-generated. Detection results are not absolute proof. Human-written text may sometimes appear AI-like, and AI-generated text may be modified or paraphrased.
